TITLE: A Numerical Laplace Transformation

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1961, Vol. 4, No. 2,
pp. 82-91

TEXT: A study has been made of the integral

$$F(p) = \int_0^{\infty} e^{-px} f(x) dx \quad (1)$$
 which is widely used in integral transformations.

By the substitution $px = t$, this integral acquires the form

$$F(p) = p^{-1} \int_0^{\infty} e^{-t} f(t/p) dt. \quad$$
 Furthermore, this integral can be rendered in

the form $\int_0^{\infty} t^s e^{-t} \Psi(t) dt \quad (s > -1)$ by the substitution $f(t/p) = t^s \Psi(t).$ For the approximation of (2), the relation

Card 1/3

88631

A Numerical Laplace Transformation

S/170/61/004/002/009/018
B019/B060

$\int_0^\infty t^s e^{-t} \Psi(t) dt \approx \sum_{k=1}^n A_k \Psi(t_k)$ (3) is given, where $A_k = n! \Gamma(n+s+1)/t_k^{n+s+1}$
 $\{L_n^{(s)}(t_k)\}^2$ $k = 1, 2, 3, \dots, n$ (4), and

$L_n^{(s)}(t) = (-1)^n t^{-s} e^t d^n(t^{s+n} e^{-t})/dt^n$, are Laguerre polynomials of nth degree. This mode of calculating (1) offers good results. The roots of Laguerre polynomials of nth degree $y = L_n^{(s)}(t)$, which is known to satisfy the differential equation $ty'' + (s+1-t)y' + ny = 0$, are determined by way of a nonlinear system, from which it may be seen that the coordinates of the equilibrium points of free electric charges coincide with the roots of $L_n^{(s)}(x)$. A bulky Table gives, for $s = -2/3, -1/2, 1/3, 1/3, 1/2, 2/3, 4/3, 3/2, 5/2$, the values of t_k and A_k for $n = 4 \dots 10$, and $k = 1 \dots 10$. V. I. Krylov is thanked for guidance and advice. There are 1 table and 5 references: 3 Soviet, 1 British, and 1 US.

AUTHORS: Rubanov, A. S., Metel'skiy, A. S., Gairilova, Ya. N., and Kogan, A. Sh.

TITLE: Calculation of the entropy of probability distributions of the co-ordinates and momenta
of an harmonic oscillator

PERIODICAL: Akademiya nauk Belaruskay SSR. Doklady, v. 6, no. 4, 1962, 220-222

TEXT: The purpose of the article is to check the assumption that the co-ordinate and momentum entropies
in a harmonic oscillator increase with the number of the stationary state level (Rubanov A. S., Stepanov B.I..
DAN SSSR, 140, 1, 1961). The entropy of the probability distribution of the above variables for the v -level
is found from the expression

$$H^v - \ln a = - \int_{-\infty}^{+\infty} \frac{e^{-y^2}}{\sqrt{\pi} 2^v v!} H_v^2(y) \ln \frac{e^{-y^2}}{\sqrt{\pi} 2^v v!} H_v^2(y) dy \quad (4)$$

$a = \sqrt{\frac{h}{\mu \omega}}$ for the entropy of the co-ordinate distribution and $a = \sqrt{\mu \omega h}$ for the entropy of the momentum
distribution, where μ is the mass and ω the frequency of the oscillator. In calculation, the integral taken
twice, with the lower limit of 0 and the upper limit of b was chosen so that the value of the integral re-
mained unchanged with the increase of b .

Card 1/2

Calculation of the entropy...

S/250/62/006/004/001/001

I024/I224

The integral was evaluated by the Simpson rule with a step $h = 0.001$, on an electronic computer "Minsk-1". The coordinate and the momentum entropies were calculated for the first 12 levels of the oscillator. Rubanov and Stepanov found the upper limits of the coordinate and momentum entropies:

$$H_q^v - H_q^0 = H_p^v - H_p^0 \leq \frac{1}{2} \ln 2(v + \frac{1}{2}). \quad (6)$$

For $v \leq 12$, $H_q^v - H_q^0 = H_p^v - H_p^0$ are less than $\frac{1}{2} \ln 2(v + \frac{1}{2})$ by about 0.5–0.6 of the coordinate and the momentum entropies with the increase of v was confirmed. The difference $[(H^v - H^0) - \frac{1}{2} \ln 2(v + \frac{1}{2})]$ was found to increase with the number v , tending to a certain limit as $v \rightarrow \infty$. The values of $[H^v - H^0]$ and the corresponding differences of the upper entropy limits are given. These differences decrease as v increases. There are 2 tables.

AUTHOR: Metel'skiy, G. (Vil'nyus)

TITLE: Binding of Refractory Particles

PERIODICAL: Tekhnika molodezhi, 1960, No. 12, pp. 34 - 36

TEXT: In this popular scientific article the author reports on the new high-molecular coagulant medium - polyacrylamide - which was discovered in the laboratoriya Instituta vysokomolekulyarnykh soyedineniy Akademii nauk SSSR (Laboratory of the Institute of High Molecular Compounds of the Academy of Sciences USSR). M. N. Savitskaya, Candidate of Chemical Sciences, succeeded in obtaining this new substance which was passed on to the Institut gallurgii (Institute of Halurgy) for further investigations. It turned out that polyacrylamide has a 20-times stronger effect compared to starch and accelerates precipitation in some cases 100 to 1000 fold. A heavy demand made it necessary to shift the production of polyacrylamide from the test workshop of the institute to the Bryansk fosforitnyy zavod (Bryansk Phosphorite Plant) where acrylnitrile is

Card 1/3

86674

Binding of Refractory Particles

S/029/60/000/012/004/005
B013/B077

produced from acetylene and prussic acid. By means of hydrolysis at a temperature of 200°C acrylamide is obtained. The latter is polymerized to polyacrylamide by means of hydrogen peroxide. The action of polyacrylamide probably is based on the principle of electric discharge, however, in contrast to numerous other coagulants it causes not only a discharge of negatively but also positively charged particles. Presently, polyacrylamide is also produced in other plants in the USSR, such as in the Donbass (Donets Basin). In the Yasinovskiy zavod (Yasinovka Plant) polyacrylamide is produced for its own demand; it is applied to pipelines in order to stop the wear caused by floating particles. A modern hydraulic mining process which was recently introduced in some coal mines showed a decrease of the loss of coal from 40 g per liter down to 0.3 g per liter. In the Akademiya kommunal'nogo khozyaystva imeni Ye. Panfilova (Academy of Municipal Services imeni Ye. Panfilova) in Moscow and Leningrad polyacrylamide was used successfully to improve the tap water. Most probably it can be applied to purify waste water and therefore might avoid the pollution of waterways. In the laboratoriya polimerov Agrofizicheskogo instituta Vsesoyuznny akademii sel'skokhozyaystvennykh nauk imen. Lenina (Laboratory of Polymers at All-Union Academy of Agricultural Sciences imen. Lenin) (Laboratory of Polymers at All-Union Academy of Agricultural Sciences imen. Lenin)

Card 2/3

the Institute of Agricultural Physics of the All-Union Academy of Agricultural Sciences imeni Lenin) successful tests were made to improve the soil and the cultivation of claysoil. In 1959 data were published which were obtained by an expedition of the Academy of Sciences USSR to the Kurskaya Spit. With the help of polyacrylamide it was possible to stop the plague of this district, the drifting sand, and to transform the sand dunes into grassland. The interest in polyacrylamide and the demand for it increase daily. The Bryansk plant receives not only enthusiastic letters from persons who have tested it but also requests to supply it for most different applications. The following scientists are mentioned: Fedor Yakovlevich Pisar'kov, head of the testing department of the Institute of Metallurgy, Lera Viktorovna Lyukova, engineer, head of production of the Bryansk Phosphorite Plant, N. N. Bryantsev, director of that plant, Boris Semenovich Lakhter, engineer, head of the obogatitel'naya fabrika (Dressing Plant), Ivan Andreyevich Romanov, aspirant, coworker in the Laboratory for Polymers of the Institute of Agricultural Physics of the All-Union Academy of Agricultural Sciences imeni Lenin. There are 7 figures.

TITLE: On the Possibility of Using the Automatic Range Tracking System for
Measuring the Speed of Moving Objects

PERIODICAL: Tr. Leningr. in-t aviats. priborostr., 1958, No. 18, pp. 113-124

TEXT: The block diagram of the automatic range tracking system contains a time discriminator, an integrator and a time modulator. The following shortcomings are inherent to a system with one integrator: 1) tracking an object moving with a constant speed is performed with a constant error; 2) tracking an object moving with an acceleration is performed with an increasing error; 3) when the reflected pulses disappear the system retains the range value worked out last, whereas the true range keeps changing. In order to eliminate the above-mentioned shortcomings, it is proposed to introduce in the system a second integrator which gives the automatic range tracking system a number of new

JB

properties. An analysis of stability of the system with two integrators is carried out. A correcting circuit must be added to the system. The author suggests to realize the correcting circuit in the form of a RC cell placed on the input of the second integrator. Errors originating at an accelerated motion of an object are considered. Some suggestions on the choice of the system parameters are made. There are 3 illustrations and 5 references.

Osnovy radiolokatsii (Fundamentals of Radar) Leningrad. Sudpromgiz, 1959. 350 p. Errata slip inserted. 25,500 copies printed.

Editor(s): Ed.: L. D. Gol'dishteyn; Ed.: Ye. N. Shairak; Tech. Ed.: N. V. Erastova.

PURPOSE: This book is intended for radio specialists and students of studying radar. It was approved by the Ministry of Higher Education, USSR, as a textbook for radio engineering departments of universities.

COVERAGE: The authors discuss basic principles of radar. They describe pulse, frequency and phase methods of ranging and explain methods of determining azimuth and elevation of objects. They also analyze errors in measuring coordinates by means of radar and discuss factors determining the operating range of

Card 1/9 ->

TITLE: On the Vegetation of the Periglacial Regions of the Central
Russian Plain (O rastitel'nosti periglyatsial'nykh zon tsen-
tral'noy chasti Russkoy ravniny)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 2, pp 393-396
(USSR)

ABSTRACT: The Russkaya (Russian) Plain is generally supposed to have
been covered with ice crusts of various size several times
during the Pleistocene. Each of these glaciations probably
was divided into periglacial regions of different width,
which were unequally located in addition. Scientists hold
different views concerning these regions. In the aforesaid
region no remains of tundra flora have been found yet in
anthropogenetic deposits, apart from Betula nana L, which
even now is being found here and there within this region.
But remains of typical tundra plants were found in various
places of the Baltic countries and west Siberia. The more
interesting is the finding of tundra plant remains (in addition
to some others) in the above-mentioned sediments in the

Card 1/4

SOV/2o-125-2-44/64

On the Vegetation of the Periglacial Regions of the Central Russian Plain

surroundings of Moscow (9-10 km westward in the wall of a gravel pit between the town of Rublevo and the village of Myakinino). The local peat deposit now is almost completely exploited. 3-4 years ago, there were found unspecified bones of a mammoth or *Trogontherium* here. On the basis of own observations, publications (Refs 1, 2) and data furnished by A. I. Moskvitin and V. V. Popov the authors reconstructed the geological structure of the region mentioned. The flood area and three terraces of the Moskva River above the former are distinctly marked. The formation of the third terrace, in the sediments of which (lower part) the known Troitskoye interglacial deposit is located, must be assigned to the Kalininskoye glaciation. This terrace was washed out in the interstadial of the latter. Their sediments are characterized by fossil phenomena of freezing (Fig 1), (Refs 4-6). Plant remains were found primarily in the first terrace. Table 1 gives some spore-pollen analyses. Many leaflets of *Salix herbacea* L. and *S. polaris* Whlbg (Fig 3), a scale of *Betula cf. tortuosa* Ldb., "pod flaps" of *Draba cf. incana* L. and *Alyssum* sp. were found on the base of the sediments of the first terrace. The pollen remains (Table 1) are in no pro-

On the Vegetation of the Periglacial Regions of the Central Russian Plain

portion to that of the macroscopic plant remains mentioned, which may be explained only by redeposition due to water. It may be concluded therefrom that there was no coherent cover of grass or dwarf bushes, not to speak of a considerable peat layer. There was no Sphagnum shell. Considerable dryness in higher places did not permit the formation of freezing phenomena. Soil was lacking almost completely. Ephedra, Chenopodiaceae and Artemisia were found there. Woods were scarcely spread, in which firs ("lower fir region") predominated, i.e. not *Picea excelsa*, but *P. obovata* (cones were found, Fig 2), plenty of pines (*Pinus*) and birches (*Betula*). Alders were scarcely distributed (probably *Alnus fruticosa* D.C. or *A. viridis* L.). There was a cold climate. The aforesaid flora (firs) rapidly disappeared. The woods then consisted of pines and birches. Ferns (*Asplenieae* and *Aspidieae*) were subsequently widespread. The spore-pollen spectrum is a typical feature of the early Holocene (boreal period). The authors could not explain the causes of simultaneous occurrence of hygrophytic firs and xerophytic Chenopodiaceae, Artemisia and Ephedra, of xerophytic pines and birches, in addition to hygrophytic ferns, in the early Holocene. *Picea excelsa*

TITLE: Investigating the Operation of Electromagnetic Valves for Gas
Sampling from Cylinders of Heat Engines.

PERIODICAL: Tr. Kuybyshevsk. aviat. in-t, 1958, No. 6, pp. 57-61

TEXT: The author describes the design and the operation of electromagnetic valves with a drive. The instants of valve opening and closing are fixed with the aid of an electric induction time marker, whose readings are recorded by a loop oscillograph without additional amplification. The small dimensions of the valve and the simple drive make it possible to mount it in inaccessible places of the engine. There are 2 references.

AUTHOR: Metenin, V., Candidate of Technical Sciences

TITLE: Experimental Investigation of the Working Process of a Vortex Air Refrigeration Installation

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 4, pp 15-20 (USSR)

ABSTRACT: The article describes a 20 liter capacity refrigerator cooled by means of a vortex tube. Compressed air, after being dried in an adsorber, where it is partly cooled, enters the vortex tube, where it is divided into two streams of cold and of hot air; the cold air is directed into the refrigeration compartment; on leaving same it passes through the heat exchanger and from there to the outside. The plant has the form of a cylinder 1,200 mm high with a 550mm diameter and is equipped with an ejector for drawing off the air from the refrigeration compartment. A series of experiments have been conducted with this installation, which are described in the article, as well as the results obtained, showing in particular the influence of the pressure of the compressed air, the influence of the opening of the diaphragm, the influence of the parameters of the heat exchanger and the influence of the length of the vortex tube on the operation of the refrigerator and on the co-

TITLE: An Investigation of Vortical Temperature Separators for Compressed Gas

PERIODICAL: Zhurnal tekhnicheskoy fiziki, 1960, Vol. 30, No. 9,
pp. 1095-1103

TEXT: The present paper gives results of experimental investigations on vortex tubes. The most suitable types and dimensions were to be found. In the first part, the author discusses the experimental arrangement schematically shown in Fig. 1. In the second part, he discusses the experimental results, and particularly deals with the influence of the construction of a diffuser grid and the length of the vortex zone, with the influence of the nozzle\construction, with the influence of temperature of the compressed air, and the vortex effect for steam. From the results compiled in the table and in diagrams, the author concludes that the construction of the diffuser grid exerts a strong influence on the optimum length of the vortex zone, on the cold delivery, and on the temperature characteristics of the vortex tubes. The net-type diffuser grids proved to be most

Card 1/2

84450

An Investigation of Vertical Temperature Separators S/057/60/630/009616/021
for Compressed Gas B019/B054

efficient, and it appeared that the separation of hot and cold gas occurs at a short distance from the nozzles. The length of the vortex zone is longer with tangential multinozzle introduction than with single-nozzle introduction. The highest cooling effect and the maximum cold delivery is attained with tangential single-nozzle introduction as compared with tangential multinozzle introduction, with the shortest length of the vortex zone. The Ranque effect was also observed with superheated steam. There are 7 figures, 2 tables, and 13 references: 6 Soviet, 1 French, 1 German, and 4 US.

TOPIC TAGS: vortex tube, refrigeration equipment

ABSTRACT: The article starts with a theoretical consideration of the thermodynamics of the problem. On the basis of the theoretical conclusions, the article shows the design of an experimental vortex tube of optimum construction (see Fig. 2). The article gives the results of experiments with a tube of the above design with a diameter of 2. mm. The initial pressure was 49×10^4 newtons/meter², and the initial temperature was 20°C. The air flow rate through the apparatus was 120 kg/hour. Based on the experimental data, figures are given showing the effect of the pressure of the compressed air, the effect of the heat load on the cold chamber on the operating characteristics of the vortex tube, and the effect of the diameter of the opening in the diaphragm of the vortex tube. Orig. art. has: 11 formulas and 5 figures.

NAME & TITLE: *Substation equipment*

Bogor, September, 1959. Informational article.
 (The Electrotechnical and Power Supply Equipment Collection of
 Information) Moscow, Sovzvezdje, 1959. 100 p. (Soviet Technical Report)
 12,500 copies printed.

Auth. No.: 74-14578 Date: 2nd. November and 3rd. November.

Source: *Substation equipment* is intended for technical personnel of
 the Ministry of Communications USSR and its subordinate telecommunication
 enterprises.

Content: The article in this collection describes various new pieces of Soviet
 equipment used in electrical communication systems. These include:
 transistors, audio equipment, mobile radio amplifiers, transformers, cable
 converters, rectifiers, and rectifierboards. No personalities are
 mentioned. Reference: accompanying the article is footnotes.

Author: Ch. and Yu. Baranovskiy, Adu. "Public Cloud" Unit
 of the Ministry of Communications USSR. The authors describe the
 principles of operation, and the block diagram of the unit.

Article No.: 77 - 200 kW Transformer with Igniting Arrestor.
 This power transformer is designed for operation with overhead
 communication lines of wire broadcasting systems. The author describes
 the diagram and design of the transformer.

Author: V.P. Slobodchikov Telephone Station of the AZSSR Low Capacity
 System.
 This station is designed for installation in oblast or rayon
 communication centers of the subscriber's automatic telephone system.
 Its capacity is 10 subscribers and 3 voice-frequency

channels. 12

Article No.: VES Land-in Cable Cabinet Reactor
 The author lists a variety of reactors for connecting balanced cables
 of varying capacity. A table indicates the types of mounting plates
 for each reactor. The author also describes circuit diagrams and opera-
 tion of the reactor assemblies.

Author: V.M. Philippov, V.S. Kuznetsov
 The author briefly describes the structure and operation of this reactor,
 which serves for connection and termination of communication cables
 and overhead lines, and for protection of station equipment.

Author: M.V., G.A. Vol'fson, and V.P. Shchuchin. Constant Voltage
 Direct Current Converters with Transistor Triode
 These converters provide power supply for communication equipment
 by means of a single battery. The article also describes converter
 operating principles and disadvantages. Field of applica-
 tion and components. The results of experiments with 3 types of con-
 verters are shown in a table.

Author: Iu. VVS-26/30 Rectifier Assembly
 The rectifier serves as a power supply for equipment used in inter-
 urban and intracity telecommunication and in dial telephone
 systems. The author gives the circuit diagrams and design of the assembly.

Author: L.S. BMS-1 Combined Patchboard
 The patchboard connects local subscribers among themselves and connects
 long distance lines with local telephone network subscribers and via
 those of the automatic telephone system. The article describes circuit
 diagrams of various combinations of connections, structural details of
 the components and the assembly as the whole.

Author: N.M. BES-1 Drilling Rig
 The rig drills the holes for overhead line poles. The author describes
 the functional diagram, design, and operation of the assembly.

ABSTRACT: The Siberian Branch of the Academy of Sciences, USSR, (SOAN), was organized in 1958 with a Center at Novosibirsk, and with branches in Vladivostok, Krasnoyarsk, Irkutsk, Tbilisi and the Island of Sakhalin - Academician M. A. Lavrentiyev is President of SOAN and Director of its Novosibirsk Center. SOAN has 16 scientific research institutes with 1300 scientific workers, including 10 Academicians and 30 corresponding members of the Academy. The Novosibirsk Center has 12 institutes: Nuclear Physics; Semiconductor Physics; Inorganic Chemistry; Chemical Catalysis; Organic Chemistry; Hydrodynamics; Geology and Geophysics; Cytology and Genetics; Kinetics and Combustion Reaction; Economics; Heat Physics; Computing Center. Every institute has its own design offices and experimental laboratories. A large experimental plant serves also as a training center for the Novosibirsk University students, for the Center scientific personnel, and also for industrial workers of various Siberian plants. SOAN achievements

since its establishment are many and in various fields, such as pest control in Siberian forests; method of determining the selection of catalysts for particular reactions; development of a neutron pulse generator; development of a 200 ton pressure percussion hydraulic hammer used for crushing rock and coal deposits, etc. A close cooperation between the Center and the Novosibirsk University (founded in 1959) is assured by employing Center scientists as University professors, training advanced students in Center institutes, and recruiting most of Center's scientific staff from among the University graduates.
